# Aquarius Breake Band Use.

Break band is to hold the anchor parked in roller or chain in gypsy when capstan is used.  
To tighten the break band turn the black wheel clock wise.  
To loosend the break band turn the black wheel anti clock wise.

Using capstan and break band:

Tighten the break band, so the anchor / chain don't go out.  
Loosend the clutch using the handle. By loosend the clutch there are no longer contact between the shaft and the gypsy, so the gypsy stand still and only capstan is turning around.

Note!

When using the windlass normally on chain, the break band must be loose and the clutch tighten.

Break band must be lubricated with sea water resistant grease approx one time each year or when needed.  
Only on the inside where there are contact between the gypsy and break band.
